

Viridian is a concept I've been thinking about for a while. It's a mobile application that helps you track your sustainability goals. Going green and having a smaller carbon footprint has been my goal since the beginning of the school year. Technology is helping us in many ways, as shown in the link posted on the Design Intern Challenge Google doc. I figured there could be a mobile application that gives tips on how to be more environmentally friendly, remind us to take action, and notify us of all the carbon emission we are producing. In this mobile application, users get to keep track of all the food they eat and see how much carbon is emitting from those certain foods. The same goes for household electricity and the transportation we take. Users can also compete with their friends to see who is living more sustainability because competition is always fun. Lastly, this application can send out notes on how to become more sustainable according to the user's current lifestyle.
